QUAIMerchant

The merchant checkout layer for Quai.

Accept payments through a familiar checkout experience — with on-chain verification and fast settlement.

Pay with Quai

✓ Payment confirmed

on-chain • verified

THE PROBLEM

Digital commerce is fast. Settlement still creates friction.

For merchants, the pain is not only “can a customer pay?” — it is how fast, how cheaply, and how confidently the merchant gets paid.

T+1**Settlement friction**

Paystack’s standard Nigerian settlement is next working day; Flutterwave says local payments are settled the next day.

1.5–2%**Transaction cost**

Paystack publishes 1.5% + ₦100 locally; Flutterwave publishes 2% for Nigeria collections.

GLOBAL ≠ SIMPLE**Cross-border friction**

International payments can add card-network restrictions, FX conversion and different settlement rules.

The opportunity: make a Quai payment feel as familiar as clicking “Pay” — while keeping settlement on-chain.

WHY QUAI

Quai is already built around the properties commerce needs.

We are building the merchant layer on infrastructure designed for fast, inexpensive, programmable transactions.

FAST

Speed

Quai describes payments as "swipe-a-card fast."

<\$0.01

Cost

Quai currently advertises fees below \$0.01 per transaction.

255K+ TPS

Scale

Quai currently states 255,000+ TPS peak capacity.

EVM

Programmable

EVM-compatible smart contracts use familiar Solidity tooling.

THE SOLUTION

QUAIMerchant turns Quai into a merchant-ready checkout.

Think Paystack-style developer experience — but with the payment verified directly on Quai.

checkout → on-chain verification → webhook → fulfillment

THE PRODUCT

Simple for the customer. Familiar for the developer.

The MVP focuses on one complete payment loop that can be demonstrated live.

Premium Hoodie

₦18,500

Pay with Quai

Developer experience

```
<PayWithQuai\n  amount="18500"\n  currency="NGN"\n  orderId="ord_1024"\n/>
```

WHY NOT JUST PAYSTACK OR
FLUTTERWAVE?

We are not trying to replace them. We open a different payment rail.

Keep traditional rails for customers who want them — and add a Quai-native option for digital and cross-border commerce.

	Paystack	Flutterwave	QUAIMerchant
Local settlement	T+1 standard	Next day	On-chain
Pricing model	1.5% + ₦100*	2%*	Small platform fee — TBD
International	Cards + other rails	Cards + global rails	Wallet / on-chain rail
Blockchain-native	No	No	Yes
Developer webhook	Yes	Yes	Yes

*Current published Nigeria pricing. Competitors are broader and mature; our wedge is the Quai-native payment rail.

HOW WE MAKE MONEY

Monetize the payment flow — then grow with the merchant.

The source proposal does not lock a final fee, so we present the model without inventing a number.

PER PAYMENT

1 • Transaction fee

A small fee on successful payments. Final rate is validated against merchant willingness-to-pay and network economics.

SAAS LAYER

2 • Merchant tools

Paid dashboard features, analytics and reconciliation as merchant usage grows.

ECOSYSTEM

3 • Platform expansion

Plugins, subscriptions, mobile SDKs and integrations create additional growth opportunities.

Revenue scales with merchant payment volume — not hardware or branch expansion.

HOW WE SCALE

Start narrow. Prove the payment loop. Expand through integrations.

Nigeria is the beachhead because the problem is concrete; the architecture is designed for wider expansion.

WHY THIS CAN BECOME INFRASTRUCTURE

The moat is not the button. It is the payment network around it.

Reliable event detection, merchant integrations, plugins and ecosystem distribution can compound over time.

Integration moat

SDK + plugins + docs make QUAIMerchant part of a merchant's stack.

Reliability moat

Monitoring, retries, verification and reconciliation build trust.

Ecosystem moat

More Quai merchants create more reasons for wallets and apps to support the rail.

Data moat

Merchant analytics can improve product decisions and retention over time.

FROM HACKATHON TO PRODUCT

Build the core loop first. Add complexity only when the market proves it.

This follows the project documentation's core → polish → post-hackathon roadmap.

NOW

Contract + SDK +
relayer + demo store

NEXT

Dashboard + refunds +
conversion

THEN

WooCommerce /
Shopify + subscriptions

LATER

Mobile SDK + broader
settlement options

WHAT WE NEED

Help us turn Quai's payment capability into merchant adoption.

Our immediate goal is validation: ecosystem access, pilot merchants, developer feedback and resources to harden the payment loop.

Ecosystem access

Connect with Quai builders, wallets and teams to validate the flow.

Pilot merchants

Recruit online businesses to test checkout and settlement UX.

Build resources

Ship, test, secure and document the infrastructure.

First proof point: a real merchant completes a checkout and the order automatically becomes PAID.

THE TAKEAWAY

Payments should just work.

QUAIMerchant makes the blockchain underneath powerful — and the checkout on top familiar.

Fast. Low-cost. Verifiable. Merchant-ready.

Thank you.
